Universität Potsdam

Our goal

(image source)

We are implementing two components of the gameplay:

→ **Taboo card generator**

- pre-trained word2vec word embeddings
- WordNet via NLTK

→ **Taboo player**

- LSTM RNN using PyTorch

Part 1: The card generator

1. **Gold standard** from existing Taboo cards
 - semantic relations manually annotated
2. **Taboo word generation** for a given main word
 - five words based on probability distribution from gold standard

(image source)

Part 1: The card generator

| |
|---------------|
| taboo |
| stigma |
| verboden |
| touchy |
| forbidden |
| unmentionable |

Part 2: The Taboo player

(image source)

- **NN to generate text**
 - RNN with LSTM architecture
 - Implementation using PyTorch
- **Idea:** start with e.g. “a [main word] is a”, to get NN on the right track
